

CSE103 Coursework: Hotel Management System

Introduction

Sunny Isle is a small but famous hotel in the east region of Lukewarm Kingdom. People from all over the world visit this place for a nice and comfortable holiday. Due to such popularity, the owner of the hotel decided to expand his hotel and adopt a new **hotel management system (HMS)** to ease the management process. You are the only one chosen to design and implement this HMS because the manager is not willing to pay more than one person. Apart from that, if you copy any code from others or let someone else develop this HMS, the manager will be disappointed and immediately report this to me. **Plagiarism leads to a zero mark for this coursework.**

The manager asked you to build a Java application that provides the following basic functionalities:

1. Allow guests to book rooms or cancel room bookings.
2. Allow hotel staffs to check the status of rooms, including current and future bookings.
3. Allow guests to order meal during their stays in the hotel.

You will need to apply all the knowledge that you acquired throughout the course. **The deadline is 23:59 on Friday, the 29th of May.** This assessment contributes 80% (50% + 30%) towards the overall module grade. Your submission will be marked on the school's csse-mysql server (<http://csse-mysql.xjtlu.edu.cn/>). Subsequently, your code must work on the MySQL installations on csse-mysql. "It works on my machine" is not a valid argument when defending your assessment. You will also need to include a clear user manual of your application, describing all functionalities.

Room Booking Requirements

Below is the detailed description of the minimum functionality expected in the HMS. You must use this specification to develop the functionality of the system. You may make plausible assumptions to any unspecified details with sufficient justification in your report.

This HMS application is designed for both hotel guests and staffs. When this application is started, it should first prompt the user which mode it should work in. If the user selects staff mode, room management options should be presented. If the user selects guest mode, room booking options should be presented.

Guest Mode

The application must allow a guest to **book rooms or cancel booked rooms**. A registered guest will have a username, guest's real name, passport ID, telephone number and email address. There is no current requirement for guests to update their details, but you may add this functionality if you wish. To log in, a guest is required to input his username and password correctly. Your application must also allow new users to be registered.

Rooms in the Sunny Isle Hotel have four different types:

1. Large room with double beds.
2. Large room with a large single bed.
3. Small room with a single bed.
4. VIP room.

The plan view of the floors of the hotel is shown below. The room number starts from the room in the top-left and increases clock-wise. For simplicity, all floors of this hotel share the same plan view. The "X" in "Room X01" refers to the floor number. The hotel has 10 floors in total. I used a table to represent this plan view, but you can use any other methods to represent it in HMS when guests select their rooms.

Large double bed Room X01	Large double bed Room X02	Large single bed Room X03	Large single bed Room X04	Small single bed Room X05
<div> <div>VIP Room Room X13</div> <div>Stairs & Lobby</div> <div>Small single bed Room X06</div> <div>Small single bed Room X07</div> </div>				
Large double bed Room X12	Large double bed Room X11	Large single bed Room X10	Large single bed Room X09	Small single bed Room X08

To book a room, a guest needs to specify the check-in date, check-out date and room type. If the room is not occupied in this period, he will be presented with an option that allows him to choose the specific room to stay in. Note that choosing the room number is not a required step for guests. If he chose to skip, an empty room of the same type should automatically be arranged for him. A guest can book multiple rooms for himself and his friends.

Staff Mode

Staffs can view the booking status of all rooms inside the Sunny Isle. Each staff account is associated with a username, password, telephone number and staff ID. In HMS, you need to clearly indicate the status of a room for guests and staffs. That is, whether a

room is booked or empty. The staff should be able to see all booked dates for a specific room. For privacy issues, guests only know whether a specific room is available during their intended stay period.

Food Service Requirements

The owner of the Sunny Isles Hotel also wants to provide for guests to book their meals. A meal can be prepared at any time from 7:00 am to 10:00 pm and can only be booked two days in advance. A meal contains a list of dishes that will be prepared by several chefs. **Each chef in Sunny Isle can only prepare a set of dishes he knows and only works in certain days in each week.** The weekly work schedule for each chef is fixed.

Here is the information about chefs:

1. Karen Adam: Monday to Friday
 - a. Dishes: shrimp soup, cauliflower and mushroom stew, spicy chicken nuggets, steamed cod fish, turkey burger, veggie burger, **fried egg**.
2. Hari Philip: Wednesday to Sunday
 - a. Dishes: chicken curry, chicken masala, mutton Korma, keema curry, mushroom tikka, **fried egg, curry rice**.
3. Thalia Hensley: Monday, Thursday and Saturday
 - a. Dishes: tofu teriyaki, shrimp tempura, yaki udon, chicken katsu, salmon sashimi, **fried egg, curry rice**.
4. Nisha Moss: Tuesday, Saturday and Sunday.
 - a. Dishes: black pepper beef, pork chowmein, sweet & sour pork, gongbao chicken, pork jiaozi, soy glazed pork chops, **curry rice**.

Your Task

You are asked to design a java console program for the hotel. It should interact with users through text messages. For example, after a user has logged in, he will be presented with a list of choices:

1. Book a new room
2. Book a meal
3. Cancel a room
4. ...

The user selects a choice by typing a number and pressing enter. He will then be presented with the next list of choices. The text messages of this program are totally up to you and badly designed messages (unclear, wrong and misleading messages) will lead to mark deduction.

The final program is for both assignment 1 and 2. Room booking functions are considered as assignment 1. Staff mode and Food Service are considered as assignment 2. If you can design a GUI program (Java AWT/Swing or JavaFX) for HMS, you can have up to 5 bonus marks that will be added to your assignment 2. Your final marks for each assignment, however, will not exceed their full marks.

You also need to provide a report for this project. In your report, provide the following information:

1. A user guide of your HMS. You need to tell me critical information like username and password for your HMS if you have any. **DO NOT GIVE ME your password to your university account.**
2. The design of your database: Your Entity-Relationship Diagram.

The format of CW Submission on ICE:

Everything should be packed in a zip file. The file name of the zip file should follow this format: `YourID_givenName_familyName.zip`

For example: `123456_Jianjun_CHEN.zip`

In the root folder of the zip file, you need to include:

1. A folder called “project”, storing all of your source code. You should put your NetBeans project (or eclipse, IntelliJ IDEA project) in this folder. Your SQL scripts (*.sql files) used to create your tables should also be placed in this folder unless you use java code to create tables.
2. A document called “Reference.docx” or “Reference.pdf”, which is your reference document.

Mark Distribution

Assignment 1 worth 50% of the total marks for this module:

Item	Marks
Correct E/R diagram	15
SQL table design (SQL Script) matches the E/R diagram.	5
Java: Guest user account management	5
Java: Correct room booking mechanism	15
Java: User interface design is reasonable and clear. Users are well guided throughout the process and the corresponding booking-related information is provided.	10
Total	50

Assignment 2 worth 30% of the total marks for this module.

Item	Marks
Correct E/R diagram and SQL table design	15
Staff functionalities	5
Meal booking functionalities	5
Java: User interface design is reasonable and clear. Users are well guided throughout the process and the corresponding booking-related information is provided.	5
Bonus marks for excellent designs. (but you will not have more than 30 marks for assignment 2)	5
Total	30
